XML Publisher Report from XML Data Template

[32 Comments](#) / [Oracle Apps](#), [Oracle Apps Development](#), [Oracle Apps Technical](#), [XML Publisher](#) / By [Arun Raj](#)

I used to wonder how to develop XML Publisher reports without using rdf or sql or pl/sql concurrent program. The traditional way is to

1. Create a RDF or SQL or PL/SQL procedure
2. Register the RDF or SQL or PL/SQL report as a concurrent program and set the output to XML
3. Run the above report and get the output and save it as a XML file
4. Use the XML data in building the Template using Microsoft Word

This seemed to be a little cumbersome for me. So I was searching for alternatives. Then I stumbled upon the following solution. And I hope this helps all of you. This is part one of a series of blogs. Hope you enjoy this and come up with questions and suggestions. So let us take a look at how we can create xml report from xml data template.

The XML data template is an XML document that consists of four basic sections:

1. Parameters
2. Triggers
3. Data Query
4. Data Structure

This structure is shown in the following graphic:

Step by Step Guide to create a sample XML Data Template:

Decide on the SQL Query

In the example, we are trying to get the following data from the AP_INVOICES_ALL Table

1. INVOICE_NUM
2. INVOICE_CURRENCY_CODE
3. INVOICE_AMOUNT

The query for the same will be like below:

```

SELECT invoice_num
       ,invoice_currency_code
       ,invoice_amount
FROM   ap_invoices_all;

```

Decide on the parameters

We will be using two parameters to limit the data being retrieved:

1. ORG_ID
2. VENDOR_ID

The resulting query will be like:

```

SELECT invoice_num

```

```

        ,invoice_currency_code
        ,invoice_amount
FROM    ap_invoices_all
WHERE   org_id = :p_OrgId
AND     vendor_id = :p_VendorId;

```

That's all we need to construct the XML Data Template.

```

<?xml version="1.0" encoding="UTF-8" ?>
<dataTemplate name="invoiceData" description="Invoice Data" Version="1.0" >
<parameters>
<parameter name="p_OrgId" dataType="number" />
<parameter name="p_VendorId" dataType="number" />
</parameters>
<dataQuery>
<sqlStatement name="Q1">
<![CDATA[
SELECT invoice_num,invoice_currency_code,invoice_amount
  FROM ap_invoices_all
 WHERE org_id = :p_OrgId
      AND vendor_id = :p_VendorId
]]>
</sqlStatement>
</dataQuery>
<dataStructure>
<group name="G_INV" source="Q1">
<element name="INV_NUMBER" value="invoice_num" />
<element name="CURRENCY_CODE" value="invoice_currency_code" />
<element name="AMOUNT" value="invoice_amount" />
</group>
</dataStructure>
</dataTemplate>

```

Download PDF

[Download Here](#)

If you see the above XML Data Template, we have specified the parameters that are being used and also the SQL Query that will be fetching the data. The SQL Query is using the parameters that are being defined under the Parameters Section. **I have also included a jpeg image of the XML File Definition. Sometimes when you copy the XML Definition from the blog, you might run into "invalid characters" that can cause issues. So check the jpeg image and make use of it.**

```

<?xml version="1.0" encoding="UTF-8" ?>
<dataTemplate name="invoiceData" description="Invoice Data" Version="1.0">
<parameters>
<parameter name="p_OrgId" dataType="number" />
<parameter name="p_VendorId" dataType="number" />
</parameters>
<dataQuery>
<sqlStatement name="Q1">
<![CDATA[
SELECT invoice_num,invoice_currency_code,invoice_amount
FROM ap_invoices_all
WHERE org_id = :p_OrgId
AND vendor_id = :p_VendorId
]]>
</sqlStatement>
</dataQuery>
<dataStructure>
<group name="G_INV" source="Q1">
<element name="INV_NUMBER" value="invoice_num" />
<element name="CURRENCY_CODE" value="invoice_currency_code" />
<element name="AMOUNT" value="invoice_amount"/>
</group>
</dataStructure>
</dataTemplate>

```

www.quest4apps.com

Save the same as “.xml” file in your local system. After saving the file, you should be able to open it in the browser. Double click the xml file and the file should open. The file will look as shown below:

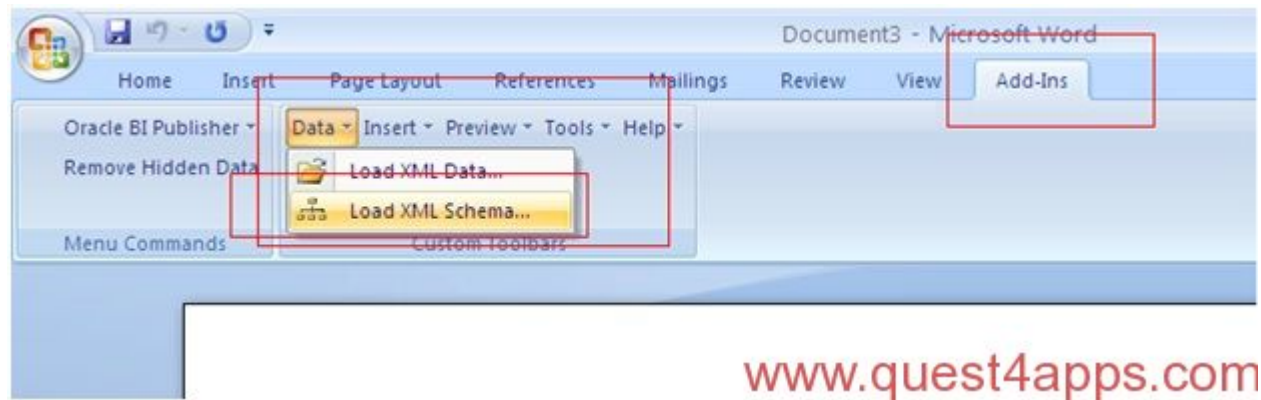

```

<?xml version="1.0" encoding="UTF-8"?>
- <dataTemplate Version="1.0" description="Invoice Data" name="invoiceData">
- <parameters>
- <parameter name="p_OrgId" dataType="number"/>
- <parameter name="p_VendorId" dataType="number"/>
- </parameters>
- <dataQuery>
- <sqlStatement name="Q1">
- <![CDATA[ SELECT invoice_num,invoice_currency_code,invoice_amount FROM ap_invoices_all WHERE org_id = :p_OrgId AND vendor_id = :p_VendorId ]]>
- </sqlStatement>
- </dataQuery>
- <dataStructure>
- <group name="G_INV" source="Q1">
- <element name="INV_NUMBER" value="invoice_num"/>
- <element name="CURRENCY_CODE" value="invoice_currency_code"/>
- <element name="AMOUNT" value="invoice_amount"/>
- </group>
- </dataStructure>
- </dataTemplate>

```

www.quest4apps.com

Open Word. Go to Add-Ins. You will be able to see the BI Publisher Menu. Under the Menu, Select Data > Load XML Schema. Select the xml file that we just created.

If the data is loaded successfully, you will get the below message:

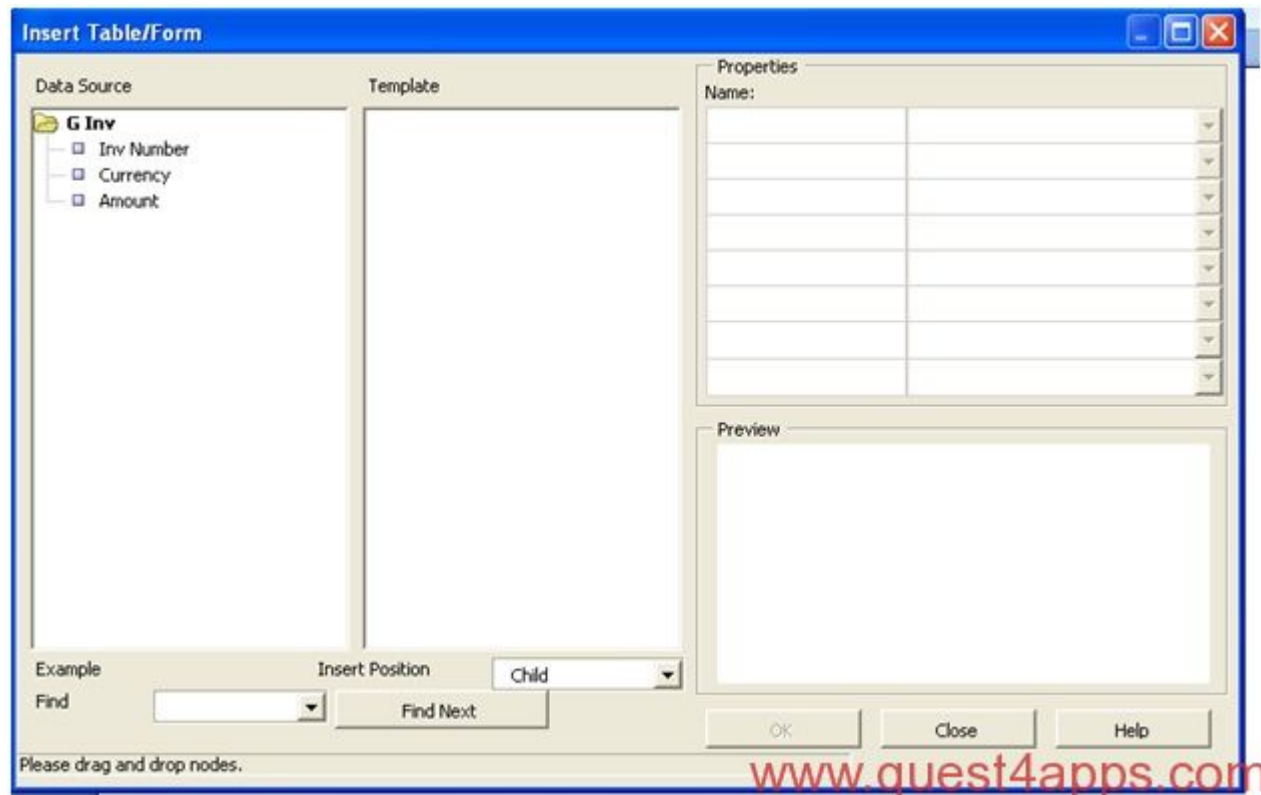

www.quest4apps.com

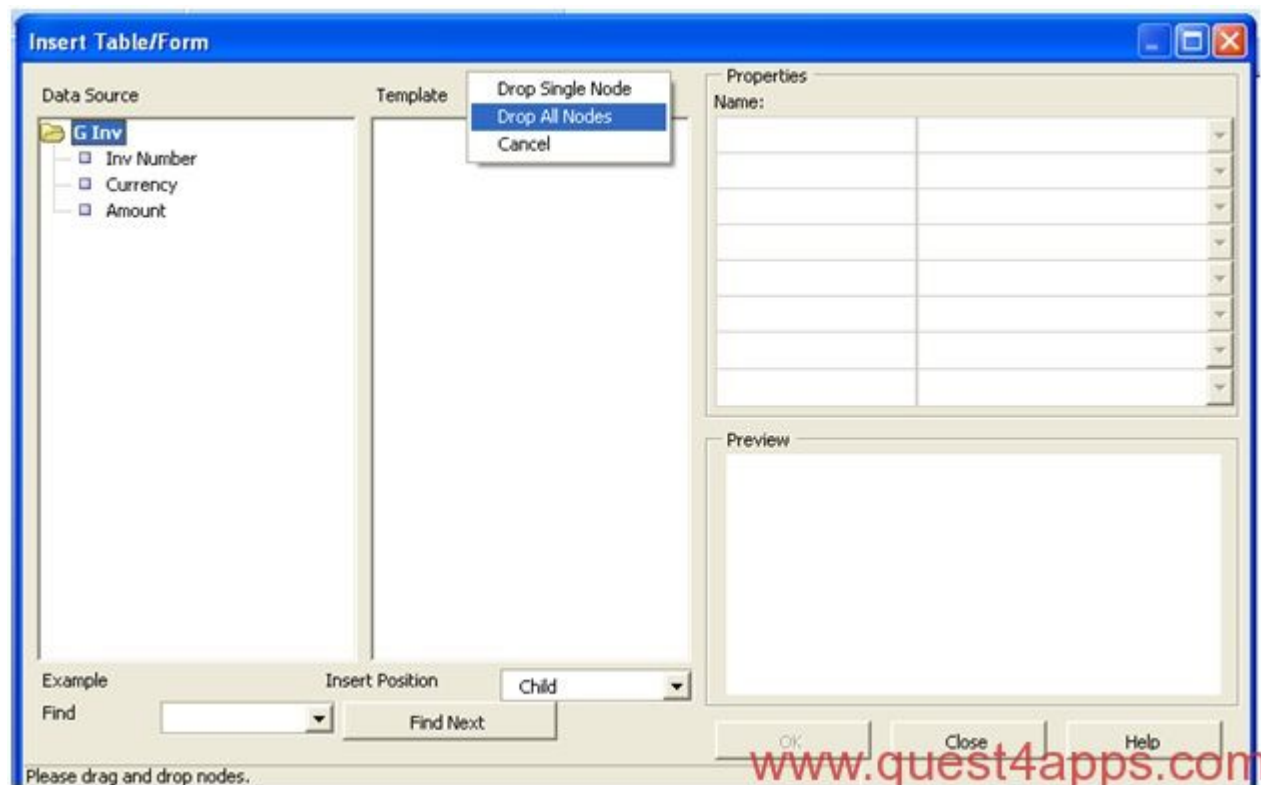

Click OK and to Continue. Select Insert > Table/Form

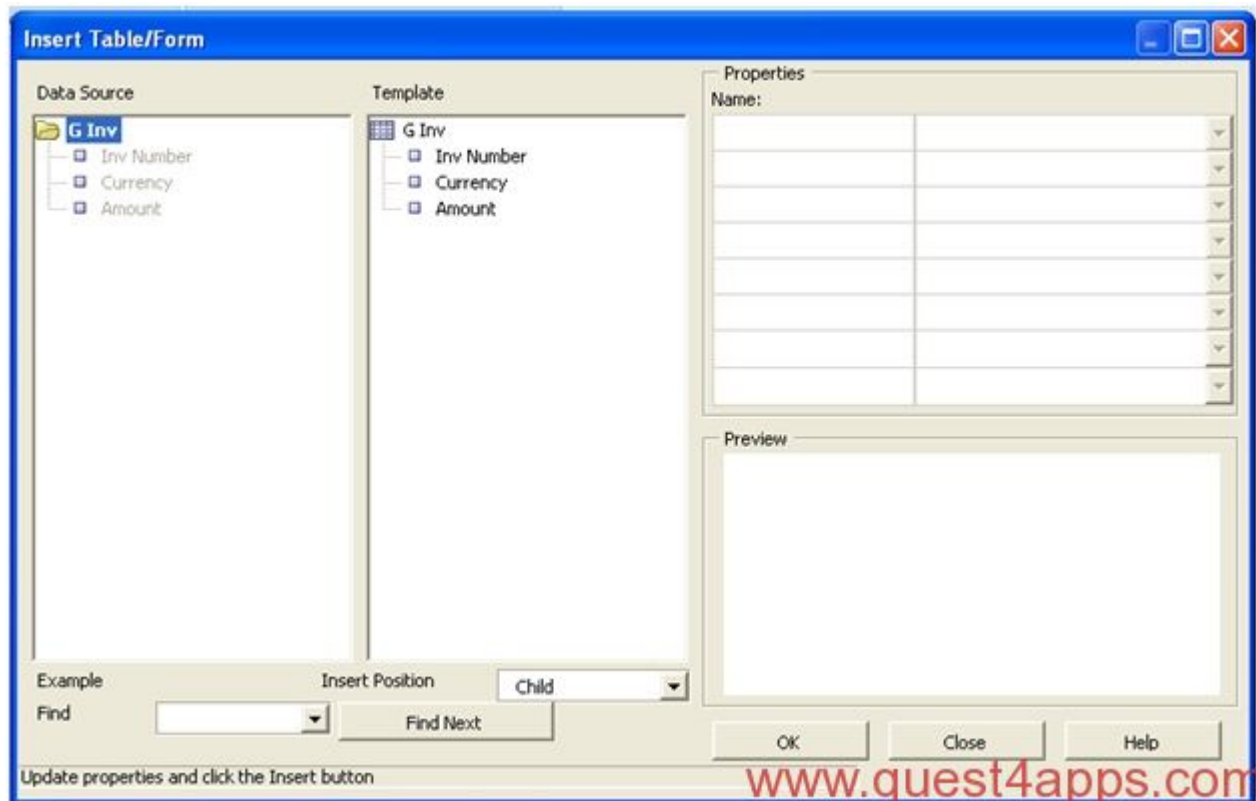

You will get the below screen:

Drag and Drop **G Inv** element from Data Source to the Template Region as shown below

Select **Drop All Nodes** from the choices. We will be getting the below screen:

Press **OK**. We will get the below template in the Word Document. Save the same as XXINV_DETAILS.rtf.

Inv Number	Currency	Amount
F INV_NUMBER	CURRENCY	AMOUNT E

Go to **XML Publisher Administrator** responsibility and create a new Data Definition. Give the following for the fields:

Name – XXINV_DETAILS

Code – XXINV_DETAILS

Application – Provisioning (or your custom application)

Start Date – Automatically Populated

Press "Add File" next to Data Template. Browse and upload the XML Data Template that we have created here.

Go to Data Templates and create a new Data Template. Give the following details:

The screenshot shows the 'Data Template' creation form. The fields are as follows:

- * Name:** XXINV_DETAILS
- Application:** Provisioning
- Type:** RTF
- * Default File:** XXINV_DETAILS.rtf
- End Date:** (empty)
- Subtemplate:** No
- Code:** XXINV_DETAILS
- * Data Definition:** XXINV_DETAILS
- * Start Date:** 06-Jul-2010
- Translatable File:** (empty)
- Default Output Type:** SRS

A watermark 'www.quest4apps.com' is visible across the bottom right of the form.

Select the Data Definition that we had created prior to this.

Select Language as US English and upload the RTF File that we have created (XXINV_DETAILS.rtf).

Navigate to System Administrator > Concurrent > Program > Define.

Create a new Concurrent Program and give the following details.

The screenshot shows the 'Define' form for a Concurrent Program. The fields and options are as follows:

- Program:** XX Invoice Details (XML) [Enabled]
- Short Name:** XXINV_DETAILS
- Application:** Provisioning
- Description:** (empty)
- Executable:**
 - Name:** XDODTEXE
 - Method:** Java Concurrent Program
 - Options:** (empty)
 - Priority:** (empty)
- Request:**
 - Type:** (empty)
 - Incrementor:** (empty)
 - MLS Function:** (empty)
 - ☒ Use in SRS
 - ☐ Run Alone
 - ☐ Enable Trace
 - ☐ Allow Disabled Values
 - ☒ Restart on System Failure
 - ☒ NLS Compliant
- Output:**
 - Format:** XML
 - ☒ Save (S)
 - ☒ Print
 - Columns:** (empty)
 - Rows:** (empty)
 - Style:** (empty)
 - ☐ Style Required
 - Printer:** (empty)
- Business Events:**
 - ☐ Request Submitted (Y)
 - ☐ Request On Hold
 - ☐ Request Resumed
 - ☐ Request Running
 - ☐ Program Completed
 - ☐ Post Processing Started
 - ☐ Post Processing Ended
 - ☐ Request Completed (Z)

Buttons at the bottom: Copy to..., Session Control, Incremental, Parameters.

A watermark 'www.quest4apps.com' is visible across the bottom right of the form.

The Executable should always be **XDODTEXE**.

Click on Parameters and give the following details:

Seq	Parameter	Description	Enabled
5	Org ID		<input checked="" type="checkbox"/>
10	Vendor Id		<input checked="" type="checkbox"/>
			<input type="checkbox"/>
			<input type="checkbox"/>

Validation Value Set <input type="text" value="3 Digit Numbers"/> Default Type <input type="text"/> <input checked="" type="checkbox"/> Required <input type="checkbox"/> Enable Security		Description <input type="text" value="Value Set for Demand Plan F"/> Default Value <input type="text"/> Range <input type="text"/>

Assign the program to the request group and run the program.

You can download the sample output file [HERE](#).

Hope this helps. Let me know your thoughts and feel free to ask any questions that you might have. Also, check out the next blog which has Triggers being called from the XML Template file. You can check it [here](#).

Hi Sarunraj, — i tried your example step by step and I'm facing a weird issue. the SQL Statment is not getting invoked in the DataTemplate.I'm not sure, if there is something wrong with the environment.

i'm a newbie to oracle apps.. can you please help.

Even tried a Simple DataTemplate as below.

Output:

-

Hi,

Are you getting any errors? What is there in the log file of the concurrent request?
You can send the files (Log file, output file, RTF Template, XML Data Template) to
arunraj@quest4apps.com

Thanks,
Raj

NISCHAL REDDY

NOVEMBER 18, 2015 AT 2:58 AM

hello..

```
select ph.po_header_id,segment1,po_line_id,item_id,quantity,authorization_status from  
po_headers_all ph,po_lines_all pl where ph.po_header_id=pl.po_header_id and rownum<=10 and  
authorization_status=:p_status
```

above mentioned query is my data query..i tried to fetch record for paramter column...in pdf
output,authorization_status values are coming same as the first column header_id...how to pass the
values of parameter column i pdf output

[Reply](#)**ARUNRAJ**

NOVEMBER 18, 2015 AT 9:34 AM

Hi Nischal,

If my understanding is correct, you are trying to display the value of the parameter ("p_Status") passed by the user to the report.

Is this correct?

If so, the parameters will be part of the XML output. If you have defined the Data Template correctly, this value will be under .. tag.

If this is not what you looking for, please let me know more details and send me the Data Template and sample XML output to arunraj@quest4apps.com.

Thanks,

Arun

APRIL 19, 2016 AT 7:03 AM

Hi can you please suggest that if we have too large data as the output of XML report and it is not getting exported in XLS file, as XLS having limit of only 64k in 97-2003 format.. can you please suggest how can we split query in XML data definition?

[Reply](#)**ARUNRAJ**

APRIL 19, 2016 AT 8:58 AM

Hi Riddhi,

Do you want to limit the number of records returned by the report (sql)? If so, you can add parameters to the report (xml data template).

Apologize if I didnt understand the question correctly.

If you still have questions or if you need more details, reply to the comment.

Thanks,
Arun
